

Abstract

An article intended to be attached to or built as an integral part of a water cooler that uses water bottles. This article has a long spear shaped part with a sharp tip in a vertical position. This article allows placing a water bottle on the water cooler while its cap is still on the bottle neck. When the bottle is placed on the water cooler, the sharp tip punctures the water bottle's cap allowing water to flow into the cooler. The benefit of the invention of this application is that it prevents any water from splattering on and around the water cooler, when placing the bottle on the cooler, as a result of inverting the water bottle into the cooler with its cap removed off its bottle neck.
